Week 1 - Programming Assignment [optional: extra credit]

This homework may be attempted several times. We will take the highest score over all attempts. It is also untimed, and you may save your answers at any time and return to it later, so don't worry about clicking on "Attempt Quiz" - it's only counted as an attempt when you click on the "Submit Answers".

Question 1

Many Time Pad

Let us see what goes wrong when a stream cipher key is used more than once. Below are eleven hex-encoded ciphertexts that are the result of encrypting eleven plaintexts with a stream cipher, all with the same stream cipher key. Your goal is to decrypt the last ciphertext, and submit the secret message within it as solution.

Hint: XOR the ciphertexts together, and consider what happens when a space is XORed with a character in [a-zA-Z].

ciphertext #1:

For completeness, here is the python script used to generate the ciphertexts. (it doesn't matter if you can't read this)

```
import sys

MSGs = ( --- 11 secret messages --- )

def strxor(a, b):    # xor two strings of different lengths
    if len(a) > len(b):
        return "".join([chr(ord(x) ^ ord(y)) for (x, y) in zip(a[:len(b)], b)])
    else:
        return "".join([chr(ord(x) ^ ord(y)) for (x, y) in zip(a, b[:len(a)])])

def random(size=16):
    return open("/dev/urandom").read(size)

def encrypt(key, msg):
    c = strxor(key, msg)
```

```
print
print c.encode('hex')
return c

def main():
    key = random(1024)
    ciphertexts = [encrypt(key, msg) for msg in MSGS]
```

Enter the decrypted message in the box below.
